1 Documentation edition and implementation scope

This is the 5.3.0 documentation edition, dated 2026-11-09. It carries forward the system and service contracts from the retained 5.2.2 documentation and identifies the current primary implementation sources. The former `documentation/v5.2.2` folder is retained unchanged.

Document version 5.3.0 is distinct from executable, dependency, registered system/service and wire-contract versions. Values still defined by the source (including 5.2.2 artefact versions, 1.0.0 service versions and `SysMonitor-AMQP-IDD-5.2.2` payload identifiers) are preserved. This documentation update does not change runtime behaviour or establish a new implementation release. Historical verification statements describe the tests recorded in the inherited baseline; this revision validates document compilation and references.

2 Service overview

Definition `sysMonitor`, version1.0.0, producer LocalCloudManager, conditional on secure mode and SYSMONITOR_ENABLED=true. Native persistent publisher-confirmed observations are emitted for echo, power and status. This is distinct from historical monitor echo. Consumers subscribe through their authorized SysMonitor/broker infrastructure; the publisher does not expose a browser subscription API for this service.

3 Semantics and reliability

Telemetry reports the running process and generated line-power/status values, not physical device measurements. Publisher sequence increases within a process; observation IDs include system/type/time/sequence. A30second ticker and reconnect/retry loop are used. Publisher confirms prove broker acceptance, not durable downstream processing or exactly-once delivery. There is no durable local outbox and no new real-broker qualification in this relocation.

4 References and verification

Authoritative moved code: LocalCloudManager/internal/cloud and embedded ui sources. Exact original/relocated SHA256 hashes are in docs/source-manifest.json. docs/legacy preserves the earlier local Markdown/SysML, not an endorsement of its parity claims. The revised SysML variability model is descriptive and has not been checked by a SysML parser. Executed checks and qualification limits are recorded in VERIFICATION.md. Source movement does not deploy or alter running clouds.

5 Revision record

2026-11-09: Documentation edition 5.3.0 derived from the retained 5.2.2 sources; metadata and local references updated. Runtime and wire-contract versions remain source-defined.
